**Use of diazepines for the preparation of medicaments intended to treat the pathological states or the diseases in which one of the somatostatin receptors is involved**

The present invention relates to the use of pyrido-thieno-triazolo-diazepines for the preparation of a medicament intended to treat the pathological states or the diseases in which one (or more) of the somatostatin receptors are involved. The invention also relates to new pyrido-thieno-triazolo-diazepines and the therapeutic compositions containing them.

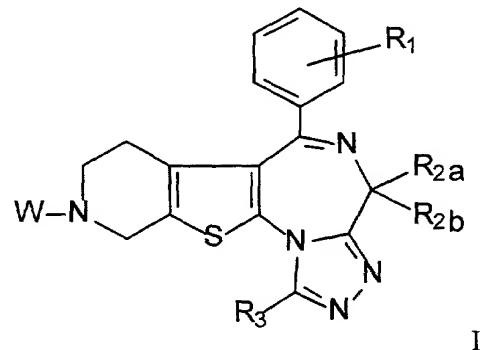

5      Somatostatin (SST) is a cyclic tetradecapeptide which was isolated for the first time from the hypothalamus as a substance which inhibits the growth hormone (Brazeau P. et al., *Science* 1973, 179, 77-79). It also operates as a neurotransmitter in the brain (Reisine T. et al., *Neuroscience* 1995, 67, 777-790; Reisine et al., *Endocrinology* 1995, 16, 427-442). Molecular cloning has allowed it to be shown that the bioactivity of somatostatin depends directly on a  
10     family of five receptors.

Among the pathological disorders associated with somatostatin (Moreau J.P. et al., *Life Sciences* 1987, 40, 419; Harris A.G. et al., *The European Journal of Medicine*, 1993, 2, 97-105), there can be mentioned for example: acromegalia, hypophyseal adenomas, Cushing's disease, gonadotrophinomas and prolactinomas, catabolic side-effects of glucocorticoids,  
15     insulin dependent diabetes, diabetic retinopathy, diabetic nephropathy, hyperthyroidism, gigantism, endocrinic gastroenteropancreatic tumors including carcinoid syndrome, VIPoma, insulinoma, nesidioblastoma, hyperinsulinemia, glucagonoma, gastrinoma and Zollinger-Ellison's syndrome, GRFoma as well as acute bleeding of the esophageal varices, gastroesophageal reflux, gastroduodenal reflux, pancreatitis, enterocutaneous and pancreatic  
20     fistulae but also diarrheas, refractory diarrheas of acquired immunodeficiency syndrome, chronic secretary diarrhea, diarrhea associated with irritable bowel syndrome, disorders linked with gastrin releasing peptide, secondary pathologies with intestinal grafts, portal hypertension as well as hemorrhages of the varices in patients with cirrhosis, gastro-intestinal hemorrhage, hemorrhage of the gastroduodenal ulcer, Crohn's disease, systemic scleroses, dumping  
25     syndrome, small intestine syndrome, hypotension, scleroderma and medullar thyroid carcinoma, illnesses linked with cell hyperproliferation such as cancers and more particularly breast cancer, prostate cancer, thyroid cancer as well as pancreatic cancer and colorectal cancer, fibroses and more particularly fibrosis of the kidney, fibrosis of the liver, fibrosis of the lung, fibrosis of the skin, also fibrosis of the central nervous system as well as that of the nose and  
30     fibrosis induced by chemotherapy, and other therapeutic fields such as, for example, cephalgias including cephalgia associated with hypophyseal tumors, pain, panic attacks,

chemotherapy, cicatrization of wounds, renal insufficiency resulting from delayed development, obesity and delayed development linked with obesity, delayed uterine development, dysplasia of the skeleton, Noonan's syndrome, sleep apnea syndrome, Graves' disease, polycystic disease of the ovaries, pancreatic pseudocysts and ascites, leukemia, 5 meningioma, cancerous cachexia, inhibition of H pylori, psoriasis, as well as Alzheimer's disease. Osteoporosis can also be mentioned.

In the Patent FR 2645153, the Applicant described diazepines which have an anti-PAF activity. The Applicant found that these products and products related to these compounds have an affinity and a selectivity for the somatostatin receptors. As somatostatin and its 10 peptide analogues often have a poor bioavailability by oral route and a low selectivity (Robinson, C., Drugs of the Future, 1994, 19, 992; Reubi, J.C. et al., TIPS, 1995, 16, 110), said compounds, non-peptide agonists or antagonists of somatostatin, can be advantageously used to treat the pathological states or the diseases as presented above and in which one (or more) somatostatin receptors are involved. Preferably, these compounds can be used for the 15 treatment of acromegalia, hypophyseal adenomas or endocrine gastroenteropancreatic tumors including carcinoid syndrome.

Therefore a subject of the invention is the use of a compound of general formula I

The compounds of formula I according to the invention and in which W represents the R-X-  
30 C(Y)- radical, can be prepared according to the process which consists of reacting a compound  
of formula (1)

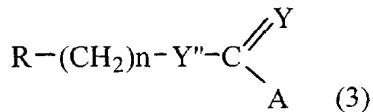

in which  $R_1$ ,  $R_{2a}$ ,  $R_{2b}$  and  $R_3$  have the meaning indicated above, with, according to the final product chosen

**A)** either a compound of formula (2)

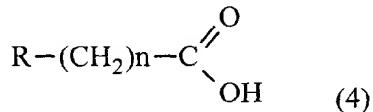

5 in which  $R$ ,  $Y$  and  $n$  have the meaning indicated above, in order to form a compound of formula I in which  $X$  represents the  $-(CH_2)_n NH-$  radical;

**B)** or a compound of formula (3)

in which  $R$ ,  $Y$  and  $n$  have the meaning indicated above,  $Y''$  represents O or S and A represents a halogen atom, in order to form a compound of formula I in which  $X$  represents the  $-(CH_2)_n-O-$  or  $-(CH_2)_n-S-$  radical;

**C)** or a compound of formula (4)

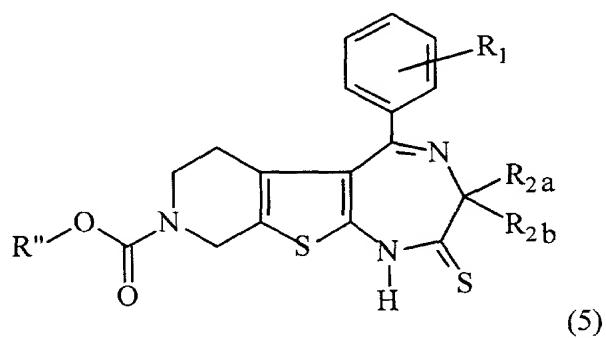

in which  $R$  and  $n$  have the meaning indicated above, in order to form a compound of formula I in which  $X$  represents the  $-(CH_2)_n$  radical and Y the oxygen atom, which compound can be optionally converted to a compound of formula I in which  $X$  represents the  $-(CH_2)_n$  radical and Y the sulphur atom.

During the preparation according to route A), the addition of the compound of formula (2) as defined above, with a compound of formula (1) is easily carried out at a temperature close to 20°C in a chlorinated solvent such as dichloromethane or 1,2-dichloroethane.

5 During the preparation according to route B), the conversion of compound (1) to a compound of formula I in which X represents the  $-(CH_2)_nY^-$  radical, by reaction with a compound of formula (3), can be carried out at a temperature close to 20°C in an inert solvent such as dichloromethane, and preferably in the presence of an acid acceptor such as triethylamine.

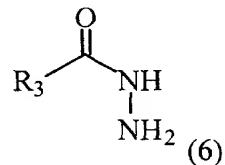

10 During the preparation according to route C), the compound of formula (1) is converted to a compound of formula I in which X represents the  $-(CH_2)_n$  radical and Y the oxygen atom, by reaction with acid (4) under activation conditions similar to peptide coupling reactions. The reaction can be carried out at a temperature close to 20°C, in an inert solvent such as dimethylformamide, tetrahydrofuran or dichloromethane, and generally in the presence of an acid acceptor such as a tertiary amine such as for example, triethylamine or diisopropylethylamine. The amide thus obtained, can be converted to a compound of formula 15 I in which X represents the  $-(CH_2)_n$  radical and Y the sulphur atom, while heating the reaction medium at a temperature close to 90°C in a polar solvent such as toluene or cyclohexane, in the presence of a thiation agent such as Lawesson reagent.

20 The starting product of formula (1) corresponds to the product of formula I in which W represents a hydrogen atom. Such a compound can be obtained by reacting a compound of formula (5)

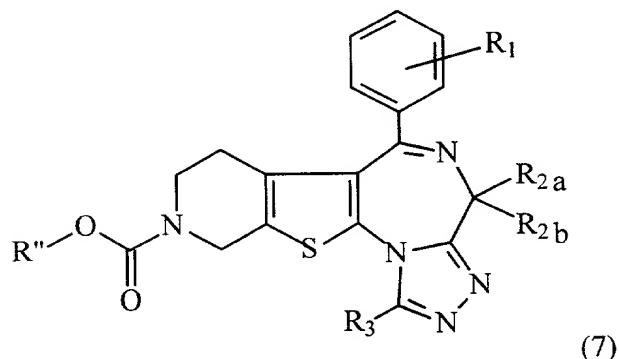

(5)

in which  $\text{R}_1$ ,  $\text{R}_{2\text{a}}$  and  $\text{R}_{2\text{b}}$  have the meaning indicated above and  $\text{R}''$  represents a lower alkyl or lower arylalkyl radical, with a compound of formula (6)

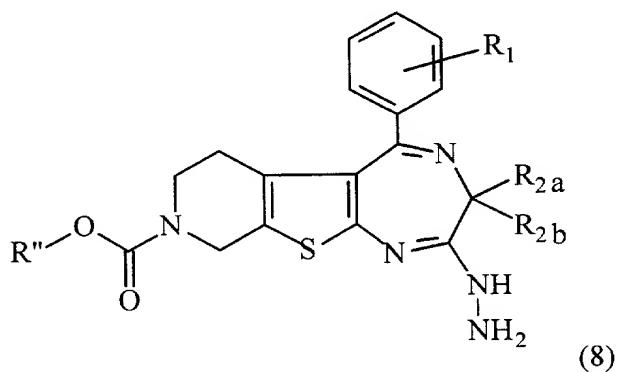

(6)

in which R<sub>3</sub> has the meaning indicated above, in order to obtain compound (7)

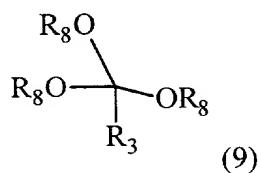

which compound is then subjected to a deprotection reaction of the carbamate in order to obtain product (1).

5 The compound of formula (1) can also be prepared by reacting a compound of formula (5) as defined above with hydrazine in order to obtain a compound of formula (8)

which compound is then reacted with a trialkyl orthoalkanoate type compound of formula (9)

10 in which R<sub>8</sub> represents an alkyl group and R<sub>3</sub> has the meaning indicated above, in order to produce the compound of formula (7) as defined above which is then deprotected.

According to the first method for the preparation of compound 1, the compounds of formula (5) react on the compounds of formula (6) such as phenyl acethydrazide, 4-hydroxyphenyl acethydrazide, while heating an inert solvent such as toluene under reflux and in certain cases for reasons of solubility a mixture of polar solvents under reflux such as the

1,2-dichloroethane/methanol mixture. Preferably, compound (5) used is such that R" represents the ethyl or ter-butyl radical. The reaction is carried out in two stages with, in a first stage, formation of the corresponding azide followed by an intramolecular cyclization reaction leading to the compound of formula (7).

5 Deprotection of the carbamate can be carried out while heating in the presence of a mineral base such as sodium hydroxide in a lower aliphatic alcohol such as ethanol or by agitating at ambient temperature in highly acid medium such as for example hydrobromic acid (33% in acetic acid) in order to produce the compounds of formula (1). Other methods of cleaving the carbamate such as those described in Protective Groups in Organic Synthesis [T.W. Green,  
10 P.G.M. Wuts; 2nd Edition, J. Wiley and sons Inc., p. 364-6 (1991)] can also be used in so far as they are compatible with the substituents constituting the pyrido thieno triazolo diazepine skeleton of the compounds of general formula (7).

According to the second method, the compound of formula (5) reacts with hydrazine in solution in water while heating an aliphatic alcohol such as ethanol, isopropanol under reflux.  
15 This intermediate hydrazine compound is then reacted with a trialkyl orthoalkanoate compound of formula (9) in order to produce a compound of formula (7).

The product of formula (5) can be prepared according to the method described in patent FR2645153 or according to similar methods.

Certain products of formula (6) are commercially available; the others can be prepared by  
20 reacting under reflux of ethanol, the alkyl ester of  $R_3\text{-CO}_2\text{H}$  acid on the hydrazine diluted to 35% in water. The reagents (9), (4) and (3) are in general marketed (for example by the firm Acros or Aldrich). The products of formula  $R\text{-}(CH_2)_n\text{-N=C=Y}$  are mostly commercially available or can be prepared by reacting the corresponding amine on (thio)phosgene according to methods known to a person skilled in the art.

25 In the case where  $R_{2a}$  and  $R_{2b}$  do not represent the hydrogen atom, the product of formula (1) can also be prepared in a similar fashion to that described in the Patent FR 2645153 with, for example, the use of 2-bromopropionyl bromide instead of bromoacetyl bromide in the second stage of the synthesis of the tetracycle.

Compounds I of the present invention have useful pharmacological properties. Thus it has  
30 been discovered that compounds I of the present invention have a high affinity for one (or more) of the somatostatin receptors. They can be used as non-peptide agonists or antagonists of somatostatin in a selective or non-selective manner.

The compounds of the present invention can therefore be used in different therapeutic applications. The compounds can advantageously be used to treat the pathological states or the diseases as presented above and in which one (or more) of the somatostatin receptors are involved.

5 An illustration of the pharmacological properties of the compounds of the invention will be found hereafter in the experimental part.

These properties make the products of formula I suitable for a pharmaceutical use. A subject of the present application is also, as medicaments, the products of formula II as defined above, as well as the addition salts with pharmaceutically acceptable mineral or organic acids of said  
10 products of formula II, as well as the pharmaceutical compositions containing, as active ingredient, at least one of the medicaments as defined above.

The invention therefore relates to the pharmaceutical compositions containing a compound of formula II according to the invention or a pharmaceutically acceptable addition salt of acid of this, in combination with a pharmaceutically acceptable support. The pharmaceutical  
15 composition can be in the form of a solid, for example, powders, granules, tablets, gelatin capsules or suppositories. Appropriate solid supports can be, for example, calcium phosphate, magnesium stearate, talc, sugars, lactose, dextrin, starch, gelatin, cellulose, methyl cellulose, sodium carboxymethyl cellulose, polyvinylpyrrolidine and wax.

The pharmaceutical compositions containing a compound of the invention can also be presented  
20 in liquid form, for example, solutions, emulsions, suspensions or syrups. Appropriate liquid supports can be, for example, water, organic solvents such as glycerol or glycols, similarly their mixtures, in varying proportions, in water, with added pharmaceutically acceptable oils or fats. The sterile liquid compositions can be used for intramuscular, intraperitoneal or subcutaneous injections and the sterile compositions can also be administered intravenously.

25 The following examples are presented to illustrate the above procedures and should in no event be considered as a limit to the scope of the invention.

1-benzyl-6-(2-chlorophenyl)-7,10-dihydro-N-(2-trifluoromethylphenyl)-4H-pyrido [4',3';4,5] thieno [3,2-f] [1,2,4] triazolo [4,3-a] [1,4] diazepine-9(8H)-carbothioamide

Trifluoromethylphenylisothiocyanate (0.56 g, 0.0027 mol) is added to a mixture containing 1-benzyl-6-(2-chlorophenyl)-7,8,9,10-tetrahydro-4H-pyrido [4',3';4,5] thieno [3,2-f] [1,2,4] triazolo [4,3-a] [1,4] diazepine (0.8g, 0.0018 mol) in anhydrous 1,2-dichoroethane (13 ml). The reaction medium is agitated at ambient temperature for 12 hours. The precipitate is  
5 filtered on frit then washed with isopropyl ether, with ethyl acetate then with isopentane and finally dried under vacuum. 0.28g (24 %) of final product is obtained in the form of a pale yellow coloured solid. Melting point: 239-240°C.

### Pharmacological study

#### Study of the bond to somatostatin receptors

The affinity of the compounds of the invention on human somatostatin receptors is determined by measurement of the inhibition of the bond of somatostatin-14 labelled with iodine-125 ([125I-Tyr11]SRIF-14) on the receptors of transfected CHO-K11 cells.

The human genes coding for each of the sub-types of somatostatin receptors, sst1, sst2, sst3, sst4 and sst5, have been isolated and sub-cloned (*Proc. Natl. Acad. Sci. USA* 1992, 89, 251-255; *J. Biol. Chem.* 1992, 267, 20422-20428; *Mol. Pharmacol.* 1992, 42, 2136-2142; *Proc. Natl. Acad. Sci. USA* 1993, 90, 4196-4200; *Mol. Pharmacol.* 1994, 46, 291-298). The expression vectors were constructed and the cloned cell lines were obtained by transfection in mammalian CHO-K1 cells. The plasmid pRSV-neo was included as a selection factor.

The CHO-K1 cells which express in a stable fashion the human somatostatin receptors are cultured in an RPMI 1640 medium containing 10% of foetal calf serum and 0.4 mg/ml of geneticin. The cells are collected with EDTA at 0.5 mM and centrifuged at 500 g for 5 minutes at 4°C. The pellet is resuspended in Tris 50 mM, pH 7.4 and centrifuged twice at 500 g for 5 minutes at 4°C. The cells are lysed by sonication then centrifuged at 39000 g for 10 minutes at 4°C. The pellet is resuspended in the same buffer and centrifuged at 50000 g for 5 minutes at 4°C. The cell membranes obtained are stored at -80°C until the day of the experiments.

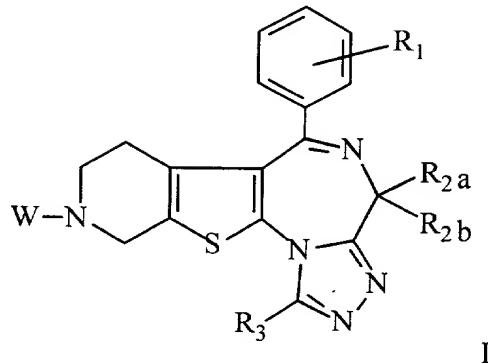

The competitive inhibition experiments of the bond of [125I-Tyr11]SRIF-14 are carried out in duplicate in 96-well plates. The cell membranes at 10 (sst2 and ss5) or 20 (sst1, sst3 and sst4) µg of proteins/well, were incubated with [125I-Tyr11]SRIF-14 at 0.05 nM (sst2) or 0.1 nM (sst1, sst3, sst4 or sst5) for 500 (sst3), 60 (sst1 and sst2), 70 (sst5) or 90 (sst4) minutes at 37°C in a HEPES 50 mM, pH 7.4, BSA 0.2 %, MgCl<sub>2</sub> 5 mM, Trasylol 200 KIU/ml, bacitracin 0.02 mg/ml, phenylmethylsulphonyl fluoride 0.02 mg/ml buffer.

After the incubation period, [125I-Tyr11]SRIF-14 free or bound to the somatostatin receptors is separated on a filtration unit (Filtermate 196, Packard) with Unifilter GF/C (Packard) filter plates pretreated with 0.1 % polyethylenimine. After washing with HEPES 50 mM, the radioactivity present on the filters is measured using a Top Count (Packard) counter.

The specific bond is obtained by subtracting the non-specific bond (determined in the presence of 0.1 µM of somatostatin-14) from the total bond. The results are analyzed by non-linear regression (MDL) and the inhibition constants (Ki) determined are comprised between 10 and 10000 nM.
